We make another pass to clear down to the LMI pebble floor. In the south this is pail 66.

**Pail 66 Level 3**
- under pail 64
- from depth of: 2.6 - 2.9
- soil: sandy brown
- pottery: 3,500gs.
- 7th century B.C.
- small amount of LMI, LMIII sherds mixed with black glazed cups
- Other: shell, stone tool
- Inventarioled:
  
As we get north about 4.5 - 5m from the south line of the trench in the east of the pass we came upon a patch of almost pure sand. We change pails to

**Pail 67 Level 3**
- under pail 65
- from depth of: 2.8 - 3.03
- soil: sand
- pottery: 650gs.
- nothing later than LMI
- small scrappy unit
- Other: 
- Inventarioled:

When we get back to the sandy earth with lots of stones we start a new pail in the north:

**Pail 68 Level 3**
- under pail 65
- from depth of: 2.64 - 2.89
- soil: sandy brown
- pottery: 4,500gs.
- Mostly LMI, lacked possible date - early LMIII A
Page 68 continued.

Other: bronze, rough plaster pieces.
Inventario: 6269 bronze.

In the very northwest part of the trench there are traces of burning, and lots of stones. We take a new pail for this area:

Pail 69 level 3
under pail 65
from depth of: 2.8 - 2.99
soil: mixture of earth and the green-grey clay with blocks of charcoal.
Pottery: 10,000 gr. (2 buckets)
nothing need be taken less than LMI.
4 tripod legs, round in section

Other: carbon, rough plaster, shell bone.
Inventario: 66791 LMI cup shards;
66792 LMI bowl

With this pail we come upon the bottom of wall 9 at 2.8m above sea level, a little above the LMI pebble court in this area. There really is a pronounced slope of the court from the east down toward the west.
Yesterday was the feast of St. Paleokar, and today was the feast of St. Paulicr, so we have been short of workmen, due to several young boys participating in the services. There has also been a bit of sickness about which has further decimated the workmen's ranks. We expect another slow day today.

We finished pail 69, measure, and the work is transferred back to Building W where we continue with pail 63.

After the feast of St. Paleokar, we got two more workmen, so we begin to take down the area south of Wall 8 and west of Wall 9 under the pebble floor of Building N. Our first pass is:

Pail 70 Level 3
under pails 19, 20 of Tr. 276 (see NBp 53)
from under depth of 3.7 - 3.9
soil: brown earth (very hard and dry)
pottery: 5,620 gr. 1 bucket LME
limestone fragments include: conical cups, pyx, nudity-painted jar, semi-glazed cups

Other: bone, shell, plaster

Inventoried: C 6794 part of loomweight, LMI

In the northeast corner of walls 8 and 9 there are orange streaks in the soil and also some traces of burning.
Having finished Pail 63, we take elevations and then make another pass.

**Pail 71 level 1**
- **Under Pail 63**
- **From depth of:** 4.18 - 4.51
- **Soil:** sand
- **Pottery:** 470 gr. and 4th century B.C.
  - black glazed goblet bases.
- **Other:** carbon
  - Invertible

With this pass, we uncover a north-south wall, marking the eastern limit of Building W. We designate this as Wall 13. It is just on the N-S line of the eastern border of Tr. 50A. There is a doorway 56.5 cm wide from the north end of this Wall 13 and the south face of Wall 6. The wall then extends 2.04 m south where it continues with Wall 11. We find the northern face of Wall 11 which is 50 cm wide. Wall 13 seems to be slightly less wide. After we still do not have the corner between Walls 11 and 12. Several stones are missing from the upper levels in the southwest corner of "Building W"

Walls 6, 11, 12, and 13 thus define a small room or "space A" with interior dimensions of 2.15 x 1.88 m. Inside the room, we have a number of stone blocks. The largest stone block in the north center of the room measures 48 x 30 cm.

What is the function of this little room? A room with a door and a stone wall, such as would be expected of a room or "space A" with interior dimensions of 2.15 x 1.88 m. Inside the room, we have a number of stone blocks. The largest stone block in the north center of the room measures 48 x 30 cm.
Part 71 is limited to inside the small room or "Space A" of Building W. To the east of wall 13 we start a new part.

**Part 72: Level 1**

*Under part 63*

*From depth of 4.23 - 4.7*

*Soil: Sand*

*Pottery: 3,280 gr. late 4th century - early 3rd century BC*

*Black glazed goblet bases*

*Other: carbon, bone, pumice*

*Inventoried*:

There is an area of burnt sand just to the east of wall 13 and to the south. We got a carbon sample from this area.

We clear all the sand down to a hard packed loessite surface in part 72. At the entrance into space A the top of two stoves appear which may be a threshold.

- continued on p 133
We continue to take down the area of the pebble floor of Building N to the south of wall 8 and to the west of wall 9.

**Pail 73 level 3**
- **under pail 70**
  - from depth of: 3.16 - 3.7
  - soil: sandy brown
  - pottery: 8,390 gr. LM IIIA with MM III
  - 3-4 "hearth" slabs
  - join with pail 70

**Other: shell, stone**
- Inventoried: C6832 LM IIIA, closed shape, join with pail 70
- C6833 MM III, painted kid
- C6834 3 shells, Cycladic import
- C6835 import
- C6836 base of Corinthian jar
- S1551 cobble, S1563 cobble fragment

We find another piece of the red shale or red ochre material and also green stone which we save. We reveal the southern face of wall 8. There are two large ashlar blocks (1.33 x 0.98 m and 0.96 x 0.98 m)

The top of these blocks is at 4.07 m above sea level. They sit on a series of slabs 5 cm thick at 3.68 m above sea level. At the end of pail 73 we reach a layer of the green-grey lepida. We change pails.

**Pail 74 level 3**
- **under pail 73**
  - from depth of: 3.27 - 3.46
  - soil: green-grey clay
  - pottery: 2,670 gr. LM IIIA
  - conical cups, bridge-spouted jars, ladle, scrap of barbotine, straight-sided cup

**Other: Plaster, shell**
- Inventoried: C6895 barbotine sherd MM III

We find bits of plaster, mostly rough backing stuff, but one piece has a smooth surface.
We have a surface outside of Space A, but not inside. We make another pass inside Space A to try and find floor level.

Pail 75: level 2
Under pail 71
from depth: 4.08 - 4.21
Soil: sandy brown
Pottery: 750 g. 4th century BC.
At least one datable goblet base, a lamp, and a tell slightly outturned rim.

Other: carbon, bone shell
Inventoried:

We come upon a number of horizontal slabs. The earth is more sandy in the east and less sandy in the west.

There is a gap or hole in wall 13. On the interior of Space A, it starts at 32 cm north of the southeast corner of space A. On the exterior it starts at 37 cm north of the exterior southeast corner of building W. On the interior the hole is 15 cm wide. On the exterior it is 10 cm wide at the bottom, but 5 cm wide at the top. The top slab of wall 13 being placed over the hole gives it a corbelled vault look. In the interior a slab is placed at the bottom of the hole. From the slab to the top of the hole is 30 cm. On the exterior the bottom of the hole goes below the surface of pail 72.

The large stone block in the center of space A is on top of another block. Stone plaques seem to have been piled in a circle around it.

One imagines the hole was used as a drain, draining out of Space A to the east. The slab at the bottom of the drain slopes to the east, out of Space A, as checked by Julianna Bianco and her bubble level.
We finish pail 74 and take measurements. There is another large stone boulder in the west. In fact the whole scarp there is full of large stones. We make another pass in Building N, south of Wall 8 and west of Wall 9.

**Pail 74 level 3**

- Under pail 74
- From depth of: 3.04 - 3.27
- Soil: brown earth
- Pottery: 9,500 gr.  LM III A: 1
- Joins with C6832, buckets 70, 73

**Other:** shell, bone, bronze, plaster

**Inventarioled:**
- C6896 base of lamp
- C6897 LM III A:1 cup & bowl sherd
- C6898 ladle handle

At the same time we clean along the top and especially along the southern face of Wall 7.

**Pail 77 level 1**

- Under surface
- From depth of: 3.09 - 3.76
- Soil: brown earth
- Pottery: ca. 50 sherds
  - Classical plus amphora fragments
  - Black glazed cup base

**Other:** shell

**Inventarioled:**

We trace Wall 7 on the south till it runs under Wall 12 of Building W. Two stoves appear 20 m south of Wall 7 at about 3.19 m above sea level. They are probably nothing, but could just be the end of a lower wall.
We finish pail 76 and make one more pass down to the level of the bottom of wall 9.

Pail 78 level 3
under pail 76
from depth of: 2.89 - 3.04
soil: brown earth
pottery: ca. 600-700 sherds
   All Minoa - latest date LM IIIA B (laddle handle)
   Many LM II sherds

Other: carbon, plaster, bronze, stone.
Inventario.

We continue to find lumps of plaster and there are also flecks of charcoal. A funny double lump of bronze comes up right next to two pieces of a coarse yellow fabric with incised decoration.

A large broken but originally ashlar block (ca. 90 x 70 x 90 cm) has fallen at an angle on the pebble floor or just above it. We decide to leave it as evidence of the fill to raise the level of the court in the Late Minoan III Period. Two other very large stones are visible.
K83/2

of southern face of wall &

after fall 79, showing

large block left in place

...
Back in Building W we do a little sounding inside space A.

Pail 80 level 2
under pail 75
from depth of: 4.0 - 4.10
soil: sandy brown soil
pottery: ca. 25 sherds
Classical

Other: 1 shell, carbon
Inventoried

First we dig just to the south of the large block. It is sitting on top of another block which seems to be straight on the north but rounded to the south. We then dig in the doorway to Space A. We find a slab at about floor level on the south and to the north a yellow slab is about 10 cm lower. We also dig a little in the southeast corner of Space A. Under the floor we find many traces of burning and one shell in this burnt area. A very large amount of charcoal appears in the southeast corner and we take a sample. In this area wall 11 projects a little to the north. Basically, we find nothing here. All indications are that we have gone beneath the floor, so we fill in the holes and finish the pail.

We now do a small probe to the east.

Pail 81 level 2
under pail 72 -3.84 - 4.21
from depth of: dark (burnt) sand and earth mixture
soil:
pottery: ca. 100 150 sherds
Classical
K83/10:34-5 Views from East of slabs against wall 13 (blocking drain) after Pail 81

Against the outside of the drain we find a large stone slab (52 x 42 x 10 cm). It is placed on top of stone rubble. To the south is placed another slab (30 x 35 x 5 cm). To the north, right against the large slab is a third slab (30 x 32 x 5 cm). Elevation of the slabs is at 4.18.

Giuliana Bianco comes and sets in a pin for a permanent point in the middle of wall 11.

I give Giuliana a pail labelled 'Building J' and she goes and does a sounding along the east wall of building J inside the little room built against this wall. The horizontal course was interrupted at one point. Underneath the stone of the second course the stone of the first course was aligned with that of the second course, which suggests that a door may have been positioned there originally, which was filled in and altered in the LMIII period.
We take one last pad to clean down the main surface of the trench to the LMII pebble court.

Pail 82 Level 3

Under Pad: C2
Draped Pad: 
Soil: 
Pottery: 100-125 sherds
LMIII B lidle fragment
1-2 Iron Age sherds

Other:
Invented:

Unfortunately due to lack time this pad has not been completed. There seems to be quite a bit of cleaning up which should be done to get down to the level of the court.
